Why Are Pre-Algebra Word Problems So Important?

Before we get our hands dirty with problems, it's crucial to understand **why** they matter. Pre-algebra is the bridge between basic arithmetic and more advanced math. Word problems, in particular, help you:

1. **Develop Critical Thinking Skills:** You have to analyze the problem, identify the unknown, and choose the correct

operations.

2. **Connect Math to Reality:** They show you how math is used in everyday situations, from budgeting to planning trips.
3. **Improve Problem-Solving Strategies:** You learn to break down complex problems into manageable steps.
4. **Strengthen Algebraic Thinking:** Many word problems naturally lead to setting up and solving algebraic equations.

Understanding these skills will make your journey through pre-algebra, and beyond, much smoother.

The Essential Steps to Solving Any Word Problem

Regardless of the specific type of pre-algebra word problem, a systematic approach will dramatically increase your success rate. Here's a battle-tested method:

1. **Read Carefully and Understand:** This is the most crucial step. Read the problem at least twice. Underline or highlight key information, numbers, and the question being asked. Don't rush this part!
2. **Identify the Unknown:** What are you trying to find? Assign a variable (like 'x', 'y', or 'n') to represent this unknown quantity.
3. **Identify the Knowns:** What information is given in the problem? List these numbers and what they represent.
4. **Choose the Right Operations:** Based on the keywords and the context of the problem, decide which mathematical

operations (addition, subtraction, multiplication, division) are needed.

5. **Write an Equation (or Inequality):** Translate the problem into a mathematical sentence. This is where your variable comes into play.
6. **Solve the Equation:** Use your pre-algebra skills to isolate the variable and find its value.
7. **Check Your Answer:** Does your answer make sense in the context of the original problem? Substitute your answer back into the problem to see if it holds true. This is a vital step often overlooked!

Let's put these steps into action with some common pre-algebra word problem examples.

Common Types of Pre-Algebra Word Problems (and How to Tackle Them!)

Pre-algebra word problems often fall into several categories. Knowing these categories can help you anticipate the type of solution required.

1. Problems Involving Basic Operations (Addition, Subtraction, Multiplication, Division)

These are the building blocks. They test your ability to recognize keywords that signal specific operations. **Keywords to Look**

For:

1. **Addition:** sum, total, altogether, combined, more than, increased by
2. **Subtraction:** difference, less than, decreased by, how many more/fewer, remaining
3. **Multiplication:** product, times, of (when referring to a fraction or percentage of a quantity), each, per
4. **Division:** quotient, shared equally, divided by, per, each

Example 1: Addition Sarah has 25 seashells. Her friend, Emily, gives her 18 more seashells. How many seashells does Sarah have now? * **Understand:** Sarah starts with some shells and gets more. We need the total. * **Unknown:** The total number of seashells Sarah has now. Let's call it 's'. * **Knowns:** Sarah starts with 25 seashells, Emily gives her 18. * **Operation:** "More" and "now" suggest addition. * **Equation:** $25 + 18 = s$ * **Solve:** $s = 43$ * **Check:** If Sarah had 25 and got 18 more, 43 seems reasonable. **Answer:** Sarah now has 43 seashells. **Example 2: Subtraction** Mark had \$50. He went to the store and bought a book for \$15. How much money does Mark have left? *

Understand: Mark starts with money and spends some. We need to find out how much is left. * **Unknown:** The amount of money Mark has left. Let's call it 'm'. * **Knowns:** Mark had \$50, he spent \$15. * **Operation:** "Spent" and "left" indicate subtraction. * **Equation:** $50 - 15 = m$ * **Solve:** $m = 35$ * **Check:** Spending \$15 from \$50 should leave less than \$50. \$35 makes sense. **Answer:** Mark has \$35 left. **Example 3: Multiplication** A baker makes 3 batches of cookies. Each batch has 24 cookies.

How many cookies did the baker make in total? * **Understand:** We have multiple groups of the same size. We need the total. *

Unknown: The total number of cookies. Let's call it 'c'. *

Knowns: 3 batches, 24 cookies per batch. * **Operation:** "Each" and the idea of repeated addition suggest multiplication. *

Equation: $3 * 24 = c$ * **Solve:** $c = 72$ * **Check:** 3 groups of 24 should be more than 24. 72 is a plausible total. **Answer:** The

baker made 72 cookies in total. **Example 4: Division** 120 students are going on a field trip. They need to be divided equally into 6 buses. How many students will be on each bus? *

Understand: We have a total amount to be split into equal

groups. * **Unknown:** The number of students per bus. Let's call

it 'b'. * **Knowns:** 120 students total, 6 buses. * **Operation:**

"Divided equally" clearly signals division. * **Equation:** $120 / 6 =$

b * **Solve:** $b = 20$ * **Check:** If there are 20 students on each of the 6 buses, $6 * 20 = 120$. This matches the total. **Answer:**

There will be 20 students on each bus.

2. Problems Involving Variables and Simple Equations

These problems introduce the concept of algebra. You'll set up an equation with an unknown (variable) and solve for it.

Example 5: One-Step Equation (Addition) A number increased by 12 is equal to 35. What is the number? *

Understand: We're looking for a number where adding 12 gives us 35. * **Unknown:** The number. Let's call it 'x'. * **Knowns:**

Increased by 12, equals 35. * **Operation:** "Increased by" means

addition. * **Equation:** $x + 12 = 35$ * **Solve:** Subtract 12 from both sides: $x = 35 - 12 \Rightarrow x = 23$ * **Check:** $23 + 12 = 35$.

Correct. **Answer:** The number is 23. **Example 6: One-Step Equation (Subtraction)** When 7 is subtracted from a number, the result is 19. Find the number. * **Understand:** A number minus 7 equals 19. * **Unknown:** The number. Let's call it 'y'. * **Knowns:** 7 subtracted from, result is 19. * **Operation:**

"Subtracted from" means subtraction. * **Equation:** $y - 7 = 19$ *

Solve: Add 7 to both sides: $y = 19 + 7 \Rightarrow y = 26$ * **Check:** $26 - 7 = 19$. Correct. **Answer:** The number is 26. **Example 7: One-Step Equation (Multiplication)** The product of a number and 5

is 40. What is the number? * **Understand:** A number multiplied by 5 gives 40. * **Unknown:** The number. Let's call it 'n'. * **Knowns:** Product with 5, result is 40. * **Operation:** "Product"

means multiplication. * **Equation:** $5n = 40$ * **Solve:** Divide both sides by 5: $n = 40 / 5 \Rightarrow n = 8$ * **Check:** $5 * 8 = 40$. Correct.

Answer: The number is 8. **Example 8: One-Step Equation (Division)** When a number is divided by 3, the quotient is 11.

Find the number. * **Understand:** A number divided by 3 equals

11. * **Unknown:** The number. Let's call it 'p'. * **Knowns:** Divided

by 3, quotient is 11. * **Operation:** "Divided by" and "quotient"

indicate division. * **Equation:** $p / 3 = 11$ * **Solve:** Multiply both sides by 3: $p = 11 * 3 \Rightarrow p = 33$ * **Check:** $33 / 3 = 11$. Correct.

Answer: The number is 33.

3. Problems Involving Multiple Steps

These problems require you to perform more than one operation to arrive at the solution. They often involve combining

information from different parts of the word problem. **Example**

9: Two-Step Problem John bought 3 shirts that cost \$12 each. He also bought a pair of jeans for \$30. If he paid with a \$100 bill, how much change did he receive? *

Understand: John buys multiple items and pays. We need the final change. * **Unknown:** The amount of change. Let's call it 'c'. * **Knowns:** 3 shirts at \$12 each, jeans for \$30, paid with \$100. * **Steps:** 1. Calculate the cost of the shirts. 2. Calculate the total cost of all items. 3. Calculate the change. * **Operations:** Multiplication, addition, subtraction. * **Equations:** 1. Cost of shirts = $3 * 12 = \$36$

2. Total cost = \$36 (shirts) + \$30 (jeans) = \$66 3. Change = \$100 (paid) - \$66 (total cost) = c * **Solve:** c = 34 *

Check: 3 shirts at \$12 is \$36. Add \$30 for jeans makes \$66. \$100 - \$66 = \$34. The steps and answer seem correct. **Answer:** John received \$34 in change. **Example**

10: Two-Step Problem with Variables A store is selling

apples for \$0.50 each and oranges for \$0.75 each. If Sarah buys 4 apples and spends a total of \$4.00, how many oranges did she buy? * **Understand:** Sarah buys two types of fruit. We know the cost of one, the quantity of that one, and the total spent. We need to find the quantity of the other. * **Unknown:** The number of oranges. Let's call it 'o'. * **Knowns:** Apples cost \$0.50 each, oranges cost \$0.75 each, Sarah bought 4 apples, total spent was \$4.00. * **Steps:** 1. Calculate the cost of the apples. 2. Subtract the cost of apples from the total to find the amount spent on oranges. 3. Divide the

amount spent on oranges by the cost per orange to find the number of oranges. * Operations: Multiplication, subtraction, division. * Equations: 1. Cost of apples = $4 * \$0.50 = \2.00 2. Amount spent on oranges = $\$4.00$ (total) - $\$2.00$ (apples) = $\$2.00$ 3. Number of oranges = $\$2.00 / \$0.75 = o$ * Solve: $o = 2.00 / 0.75 = 200 / 75 = 8/3$. This is not a whole number. Let's re-read. Ah, the problem statement itself might be flawed if it expects a whole number of oranges. Let's assume for a moment that the total spent was $\$4.25$ to get a whole number answer, for demonstration. **Correction for example's sake:* If Sarah spends a total of $\$4.25$... 1. Cost of apples = $4 * \$0.50 = \2.00 2. Amount spent on oranges = $\$4.25$ (total) - $\$2.00$ (apples) = $\$2.25$ 3. Number of oranges = $\$2.25 / \$0.75 = o$ * Solve (with correction): $o = 2.25 / 0.75 = 3$ * Check (with correction): 4 apples at $\$0.50 = \2.00 . 3 oranges at $\$0.75 = \2.25 . Total = $\$2.00 + \$2.25 = \$4.25$. This matches the corrected total. **Original problem analysis:* If the total was indeed $\$4.00$, then Sarah could not have bought a whole number of oranges with these prices. This highlights the importance of checking if your answer is reasonable and if the problem itself is logically constructed. For a pre-algebra setting, we usually expect whole number answers for quantities of items. Answer (based on corrected total): Sarah bought 3 oranges.

4. Problems Involving Ratios and Proportions

Ratios compare quantities, and proportions state that two ratios are equal. These problems often involve scaling up or down.

Example 11: Simple Ratio The ratio of boys to girls in a class is 3:2. If there are 15 boys, how many girls are there? *

Understand: The relationship between boys and girls is fixed. *

Unknown: The number of girls. Let's call it 'g'. * **Knowns:** Ratio boys:girls is 3:2, number of boys is 15. * **Method:** Set up a proportion. *

Equation: $\frac{3}{2} = \frac{15}{g}$ * **Solve:** Cross-multiply: $3 * g = 2 * 15 \Rightarrow 3g = 30 \Rightarrow g = 30 / 3 \Rightarrow g = 10$ * **Check:** If there are 15 boys and 10 girls, the ratio is 15:10. Dividing both by 5 gives 3:2. This matches. **Answer:** There are 10 girls in the class.

Example 12: Proportional Reasoning If 5 pounds of apples cost \$10, how much would 8 pounds of apples cost? *

Understand: The cost of apples is directly proportional to their weight. * **Unknown:** The cost of 8 pounds of apples. Let's call it 'c'. *

Knowns: 5 pounds cost \$10, we want the cost for 8 pounds. * **Method:** Set up a proportion. * **Equation:** $\frac{5 \text{ pounds}}{\$10} = \frac{8 \text{ pounds}}{c}$ * **Solve:** Cross-multiply: $5 * c = 10 * 8 \Rightarrow 5c = 80 \Rightarrow c = 80 / 5 \Rightarrow c = 16$ * **Check:** The price per pound is $\$10 / 5 = \$2/\text{pound}$. So, 8 pounds * $\$2/\text{pound} = \16 . This matches. **Answer:** 8 pounds of apples would cost \$16.

5. Problems Involving Percentages

Percentages represent a part out of 100. They are widely used in real-world scenarios like discounts, sales tax, and interest.

Example 13: Finding a Percentage of a Number What is 20% of 150? * **Understand:** We need to find a fraction (20 out of 100) of a total. * **Unknown:** The value of 20% of 150. Let's call it 'v'. * **Knowns:** Percentage is 20%, base number is 150. * **Method:** Convert the percentage to a decimal or fraction and multiply. * **Equation:** * As a decimal: $0.20 * 150 = v$ * As a fraction: $(20/100) * 150 = v$ * **Solve:** * $0.20 * 150 = 30$ * $(1/5) * 150 = 30$ * **Check:** 10% of 150 is 15. So 20% should be double that, which is 30. **Correct. Answer:** 20% of 150 is 30.

Example 14: Finding the Original Price (Discount) A shirt is on sale for 25% off. If the sale price is \$24, what was the original price? * **Understand:** The sale price represents a portion of the original price after a discount. * **Unknown:** The original price. Let's call it 'p'. * **Knowns:** Discount is 25%, sale price is \$24. * **Method:** If there's a 25% discount, the customer pays $100\% - 25\% = 75\%$ of the original price. * **Equation:** $0.75 * p = \$24$ * **Solve:** $p = \$24 / 0.75 \Rightarrow p = \32 * **Check:** Original price is \$32. $25\% \text{ of } \$32 = 0.25 * 32 = \8 . Sale price = $\$32 - \$8 = \$24$. This matches the given sale price. **Answer:** The original price of the shirt was \$32.

Use a Table: For problems with multiple categories or time periods, a table can organize your information. * **Simplify and Rephrase:** If a problem seems confusing, try to rephrase it in your own words. * **Don't Be Afraid to Guess and Check (Strategically):** For some problems, especially in the early stages, a smart guess and then refining it can lead you to the answer. * **Practice, Practice, Practice:** The more word problems you solve, the more comfortable you'll become with identifying patterns and applying strategies. * **Ask for Help:** If you're stuck, don't hesitate to ask your teacher, a tutor, or a classmate for clarification. Questions & Answers About pre algebra word problems with answers

No	Question	Answer
1	I'm struggling with word problems! What's the best strategy to break down a pre-algebra word problem to find the answer?	The best strategy is to: 1. Read the problem carefully. 2. Identify what the question is asking you to find. 3. Underline or list the key numbers and information. 4. Determine what operations (addition, subtraction, multiplication, division) are needed. 5. Set up an equation or a series of steps. 6. Solve the problem and check your answer to make sure it makes sense in the context of the problem.

2	How do I know if I need to add, subtract, multiply, or divide in a pre-algebra word problem?	Look for keywords! 'Sum,' 'total,' 'altogether,' and 'increase' often signal addition. 'Difference,' 'less than,' 'decreased by,' and 'remain' suggest subtraction. 'Product,' 'times,' 'each,' and 'twice' point to multiplication. 'Quotient,' 'share,' 'divided by,' and 'per' indicate division. Sometimes you might need multiple steps.
3	Can you give me an example of a pre-algebra word problem involving percentages?	Sure! 'Sarah bought a shirt that was on sale for 25% off. If the original price was \$40, how much did she pay?' To solve: Calculate the discount amount ($25\% \text{ of } \$40 = \10). Then subtract the discount from the original price ($\$40 - \$10 = \$30$). Sarah paid \$30.
4	What's a common mistake people make with pre-algebra word problems, and how can I avoid it?	A common mistake is not reading the question carefully enough or misinterpreting what's being asked. Always re-read the question at the end to ensure your answer directly addresses it. For example, if it asks for the <i>*remaining*</i> amount, make sure you've performed the subtraction correctly.
5	How do I handle pre-algebra word problems with multiple steps?	Break it down into smaller, manageable steps. For each step, identify the relevant information and operation. Solve each step sequentially, using the answer from the previous step if necessary. It can be helpful to write out each step clearly.

6	I get confused with problems involving 'more than' or 'less than.' Can you explain that?	'More than' usually implies addition, but the order can be tricky. '5 more than a number (x)' is written as $x + 5$. 'Less than' implies subtraction, and it's crucial to put the quantity being subtracted <i>after</i> the first term. '5 less than a number (x)' is written as $x - 5$, NOT $5 - x$.
7	What are some good practice resources for pre-algebra word problems with answers?	Many excellent resources are available! Websites like Khan Academy, IXL, and educational publishers' sites often have practice problems with solutions. Look for textbooks or worksheets specifically designed for pre-algebra, as they usually include word problems with answers for review.

Unlocking Mathematical Understanding: A Comprehensive Guide to Pre-Algebra Word Problems with Answers

Navigating the world of mathematics can sometimes feel like

deciphering a foreign language. While abstract concepts and formulas are crucial, the true power of mathematics lies in its ability to describe and solve real-world situations. This is where **pre-algebra word problems with answers** become indispensable tools for learning and mastery. These problems bridge the gap between theoretical knowledge and practical application, equipping students with the essential skills to translate everyday scenarios into solvable equations. In this detailed, analytical guide, we'll delve deep into the significance of pre-algebra word problems, explore common types, offer strategies for tackling them, and provide a wealth of examples with clear, step-by-step solutions.

Why Are Pre-Algebra Word Problems So Crucial?

Pre-algebra serves as the foundational stage for all subsequent mathematical studies. It introduces fundamental concepts like variables, expressions, equations, and inequalities. Word problems are not merely an add-on; they are integral to solidifying these concepts. They foster critical thinking, analytical reasoning, and problem-solving abilities. Without them, students might struggle to see the relevance of what they are learning, leading to disengagement and a weaker grasp of mathematical principles.

The ability to dissect a word problem, identify the unknown quantities, and translate the given information into algebraic expressions is a vital life skill. Whether you're managing personal

finances, planning a trip, or even understanding scientific data, mathematical literacy is paramount. Pre-algebra word problems with answers provide a structured environment for developing these transferable skills. They help students move beyond rote memorization and cultivate a deeper, more intuitive understanding of mathematical relationships.

Common Themes and Types of Pre-Algebra Word Problems

Pre-algebra word problems often revolve around a few core mathematical operations and concepts. Understanding these common themes can demystify the process and make it easier to approach new challenges. Let's explore some of the most prevalent types:

Age Problems

These problems typically involve relationships between the ages of individuals, often with comparisons to past or future ages. They require careful attention to how time affects the quantities involved. Keywords like "older," "younger," "in x years," or " x years ago" are common indicators of age-related problems.

Rate, Time, and Distance Problems

A cornerstone of pre-algebra, these problems explore the relationship between how fast something is moving (rate), how long it travels (time), and how far it goes (distance). The

fundamental formula at play is **Distance = Rate $\times$ Time**.

Variations might involve comparing different speeds, calculating travel times, or determining distances covered.

Mixture Problems

Mixture problems involve combining two or more quantities with different properties (like concentrations or costs) to create a new mixture with a desired property. These problems often require setting up equations based on the total amount of each component and their respective values.

Perimeter and Area Problems

These geometric problems focus on calculating the perimeter (the distance around a shape) and the area (the space enclosed by a shape). They often involve rectangles, squares, or other basic geometric figures and introduce concepts like length, width, and units of measurement.

Proportion Problems

Proportions deal with the equality of two ratios. In word problems, they are used to solve for an unknown quantity when a relationship between two sets of values is known. For example, if 3 apples cost \$2, how much do 9 apples cost? This involves setting up a proportion.

Percentage Problems

Understanding percentages is fundamental. These problems can involve calculating discounts, calculating tax, finding a percentage of a number, or determining what percentage one number is of another. Keywords like "percent," "discount," "tax," and "commission" are strong indicators.

Solving the Puzzle: Strategies for Tackling Pre-Algebra Word Problems

Successfully solving pre-algebra word problems with answers isn't about magic; it's about employing a systematic approach. Here are effective strategies that can empower students:

1. Read Carefully and Understand the Context

This is the most critical first step. Don't skim! Read the problem multiple times, ensuring you understand the scenario and what is being asked. Identify the core question. What information are you trying to find?

2. Identify the Unknowns and Assign Variables

What are the quantities you don't know? These are your unknowns. Assign a letter (a variable, like 'x', 'y', or 'a') to represent each unknown. Be consistent with your variable

assignments.

3. Extract Relevant Information and Keywords

Underline or list all the numerical information provided in the problem. Pay close attention to keywords that indicate mathematical operations (e.g., "sum," "difference," "product," "quotient," "is," "times," "per").

4. Translate Words into Mathematical Expressions and Equations

This is where the "algebra" in pre-algebra truly shines. Convert the relationships described in the word problem into mathematical equations using your assigned variables and the extracted information. For example, "John has 5 more apples than Mary" could be translated to ' $J = M + 5$ ', where J is the number of apples John has and M is the number of apples Mary has.

5. Solve the Equation(s)

Once you have your equation(s), use your knowledge of algebraic manipulation to solve for the unknown variable(s). This might involve using inverse operations, combining like terms, or applying the distributive property.

6. Check Your Answer

This is a vital step that is often overlooked. Substitute your solution back into the original word problem and verify that it makes sense in the context of the scenario. Does it answer the question asked? Are the numbers realistic?

7. Show Your Work

Always document your steps. This not only helps you track your thinking but also allows teachers to understand your process and identify any errors. Clear explanations are key to learning.

Illustrative Examples: Pre-Algebra Word Problems with Answers

Let's put these strategies into practice with some common pre-algebra word problems, complete with detailed solutions.

Example 1: Age Problem

Problem: Sarah is 3 years older than her brother, Tom. Together, their ages sum to 25 years. How old is each of them?

Solution:

1. **Understand:** We need to find Sarah's age and Tom's age.
2. **Assign Variables:** Let 'T' represent Tom's age and 'S' represent Sarah's age.
3. **Extract Information:**
 1. Sarah is 3 years older than Tom: $S = T + 3$

2. Their ages sum to 25: $S + T = 25$
4. **Translate:** We already have our equations.
5. **Solve:** We can use substitution. Since $S = T + 3$, substitute ($T + 3$) for S in the second equation: $(T + 3) + T = 25$
 $2T + 3 = 25$
 $2T = 25 - 3$
 $2T = 22$
 $T = 22 / 2$
 $T = 11$ (Tom's age) Now, find Sarah's age using $S = T + 3$:
 $S = 11 + 3$
 $S = 14$ (Sarah's age)
6. **Check:** Is Sarah 3 years older than Tom? $14 - 11 = 3$. Yes. Do their ages sum to 25? $14 + 11 = 25$. Yes.
7. **Answer:** Tom is 11 years old, and Sarah is 14 years old.

Example 2: Rate, Time, and Distance Problem

Problem: A train travels at a speed of 60 miles per hour for 3.5 hours. How far does the train travel?

Solution:

1. **Understand:** We need to find the distance the train travels.
2. **Assign Variables:** Let 'D' be the distance, 'R' be the rate, and 'T' be the time.
3. **Extract Information:**
 1. Rate (R) = 60 mph
 2. Time (T) = 3.5 hours
4. **Translate:** The formula is $D = R \times T$.
5. **Solve:** $D = 60 \text{ mph} \times 3.5 \text{ hours}$
 $D = 210 \text{ miles}$
6. **Check:** If the train travels 210 miles at 60 mph, it would take $210 / 60 = 3.5$ hours. This matches the given time.
7. **Answer:** The train travels 210 miles.

Example 3: Mixture Problem

Problem: A grocer wants to mix nuts that cost \$4 per pound with nuts that cost \$6 per pound to create a 10-pound mixture that will sell for \$5.20 per pound. How many pounds of each type of nut should be used?

Solution:

1. **Understand:** We need to find the amount of \$4/lb nuts and \$6/lb nuts to mix.
2. **Assign Variables:** Let 'x' be the number of pounds of nuts costing \$4/lb and 'y' be the number of pounds of nuts costing \$6/lb.
3. **Extract Information:**
 1. Total weight of mixture: $x + y = 10$
 2. Cost of the first type of nut: $4x$
 3. Cost of the second type of nut: $6y$
 4. Cost of the mixture: \$5.20 per pound for 10 pounds = $\$5.20 \times 10 = \52
4. **Translate:** Equation 1 (Total Weight): $x + y = 10$ Equation 2 (Total Cost): $4x + 6y = 52$
5. **Solve:** From Equation 1, we can express x as $x = 10 - y$.
Substitute this into Equation 2: $4(10 - y) + 6y = 52$
 $40 - 4y + 6y = 52$
 $40 + 2y = 52$
 $2y = 52 - 40$
 $2y = 12$
 $y = 6$ (pounds of \$6/lb nuts)
Now, substitute $y = 6$ back into $x = 10 - y$: $x = 10 - 6$
 $x = 4$ (pounds of \$4/lb nuts)
6. **Check:** Total weight: $4 \text{ lbs} + 6 \text{ lbs} = 10 \text{ lbs}$. (Correct) Total cost: $(4 \text{ lbs} \times \$4/\text{lb}) + (6 \text{ lbs} \times \$6/\text{lb}) = \$16 + \$36 = \$52$. (Correct) Cost per pound of mixture: $\$52 / 10 \text{ lbs} = \$5.20/\text{lb}$.

(Correct)

7. **Answer:** The grocer should use 4 pounds of nuts that cost \$4 per pound and 6 pounds of nuts that cost \$6 per pound.

Example 4: Perimeter and Area Problem

Problem: The length of a rectangular garden is 5 meters more than its width. If the perimeter of the garden is 34 meters, what are its dimensions?

Solution:

1. **Understand:** We need to find the length and width of the rectangular garden.
2. **Assign Variables:** Let 'w' represent the width and 'l' represent the length.
3. **Extract Information:**
 1. Length is 5 meters more than width: $l = w + 5$
 2. Perimeter of a rectangle: $P = 2l + 2w$
 3. Perimeter (P) = 34 meters
4. **Translate:** We have the formula for perimeter and a relationship between length and width. $2l + 2w = 34$
5. **Solve:** Substitute $l = w + 5$ into the perimeter equation: $2(w + 5) + 2w = 34$
 $2w + 10 + 2w = 34$
 $4w + 10 = 34$
 $4w = 34 - 10$
 $4w = 24$
 $w = 24 / 4$
 $w = 6$ meters (width)
Now find the length using $l = w + 5$: $l = 6 + 5$
 $l = 11$ meters (length)
6. **Check:** Is the length 5 meters more than the width? $11 - 6 = 5$. Yes. Is the perimeter 34 meters? $2(11) + 2(6) = 22 + 12 = 34$. Yes.
7. **Answer:** The dimensions of the rectangular garden are 11

meters by 6 meters.
